

# Quick Deploys

Quick Deploys lets you deploy custom Endpoints of popular models with minimal configuration.

You can find Quick Deploys and their descriptions in the Web interface.

## How to do I get started with Quick Deploys?

You can get started by following the steps below:

1. Go to the Serverless section in the Web interface.
2. Select your model.
3. Provide a name for your Endpoint.
4. Select your GPU instance.
  - i. (optional) You can further customize your deployment.
5. Select **Deploy**.

Your Endpoint Id is now created and you can use it in your application.

## Customizing your Functions

To customize AI Endpoints, visit the RunPod GitHub repositories. Here, you can fork the programming and compute model templates.

Begin with the worker-template and modify it as needed. These RunPod workers incorporate CI/CD features to streamline your project setup.

For detailed guidance on customizing your interaction Endpoints, refer to Handler Functions.
